RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 98 pages. Original publisher: Washington, D. C. (441 G St. , NW, Rm. LM, Washington 20548): U. S. General Accounting Office, 1997. OCLC Number: (OCoLC)38756719 Subject: Blood -- Transfusion -- Safety measures. Excerpt: . . . B-274942 Although the risk of receiving Hrv-contaminated blood is the public's greatest fear, other diseases transmitted through blood are far more common than HIV. For example, we found that the risk of contracting HCV HIV. After infection is more than 100 times greater than that of contracting screening and testing, the likelihood that a unit of blood infected with hepatitis C virus would remain undetected and be released for transfusion is 1 in every 4, 100 units of blood; for HIV, the likelihood is 1 in every 450, 000 units. A more sensitive anti-HCV test that detects more infected units is available in Europe and has been licensed in the United States during the past year. Its use is widespread but not universal. The likelihood that a unit of blood may become contaminated by bacteria ranges from 1 in 500, 000 for red blood cells to 1 in 10, 200 for random donor platelets, the blood component used to treat certain bleeding disorders. As we discuss in Blood Supply: FDA Oversight and Remaining Issues of Safety, cited above, bacteria can enter a unit during collection as a result of either poor aseptic technique or donor bacteremia. Bacteria present in a unit can proliferate during storage. Platelets are at high risk because they are stored at room temperature; the risk of their contamination greatly increases over their storage life of 5 days. Bedside tests for bacterial contamination could greatly mitigate this problem and FDA may soon be presented to approval. We estimated that about 1 in every 2, 000 units may be...
